A U R A L I S

The Auralis frequencies

165 frequencies: phytotherapy molecules, essential oils, molecules naturally present in the body, amino acids and periodic-table elements. Each frequency is derived from the corresponding molar (or atomic) mass.

Provided for informational and cultural purposes only. This is not medical advice; Auralis makes no therapeutic claims.

Phytotherapy (59)

5-HTP — 164.1237 Hz

5-HTP (5-hydroxytryptophan) is a molecule the body uses as an intermediate step to make serotonin, itself the precursor of melatonin. It is extracted mainly from the seeds of Griffonia simplicifolia, a West African shrub. It is traditionally offered as a supplement with mood and sleep in mind. Its Auralis frequency (164.12 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 656.49 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

AKBA — 191.0491 Hz

AKBA (acetyl-11-keto-beta-boswellic acid) is one of the most studied compounds of Boswellia resin (frankincense, or olibanum). This resin has been used for millennia in Ayurvedic medicine and in Middle Eastern rituals. Frankincense is traditionally associated with joint comfort and calm. Its Auralis frequency (191.05 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1528.39 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Angelica — 277.4668 Hz

Angelica (Angelica) is a large aromatic plant whose root and seeds are used. Present both in European herbalism — where it flavors liqueurs and confectionery — and in Chinese medicine (dang gui), it is traditionally associated with digestion, circulation and female comfort. Its Auralis frequency (277.47 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 554.93 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Apigenin — 201.3930 Hz

Apigenin is a flavonoid found notably in chamomile, parsley, celery and some herbal teas. It is one of the compounds that contribute to the soothing reputation of chamomile, traditionally drunk in the evening to promote relaxation and falling asleep. It is studied for its antioxidant properties. Its Auralis frequency (201.39 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 805.57 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Asiaticoside — 178.6930 Hz

Asiaticoside is one of the active principles of gotu kola (Centella asiatica), a creeping plant of Asia very present in Ayurvedic and traditional Chinese medicine. There it is traditionally associated with the skin, healing and longevity — it is sometimes nicknamed the 'herb of longevity'. Its Auralis frequency (178.69 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 2859.09 Hz; it has been lowered by 4 octaves to fit Auralis's listening range.

Astragaloside IV — 146.2473 Hz

Astragaloside IV is the most studied compound of astragalus root (Astragalus membranaceus), one of the great tonic plants of traditional Chinese medicine, where it has been used for centuries. There astragalus is traditionally associated with supporting vital energy ('Qi') and the body's defenses. Its Auralis frequency (146.25 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 2339.96 Hz; it has been lowered by 4 octaves to fit Auralis's listening range.

Bacoside A3 — 143.2719 Hz

Bacoside A3 is one of the active principles of Bacopa monnieri, also called brahmi, an aquatic plant widely used in Indian Ayurveda. There brahmi is traditionally associated with memory, learning and mental clarity, and is the subject of much research on cognitive function. Its Auralis frequency (143.27 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 2292.35 Hz; it has been lowered by 4 octaves to fit Auralis's listening range.

Berberine 125.3340 Hz

Berberine is a bright yellow compound present in several plants — barberry, coptis, goldenseal. It has long been used in traditional Chinese and Ayurvedic medicine and is today the subject of much research, notably around sugar metabolism and digestion. Its Auralis frequency (125.33 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1002.67 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Bilobalide 243.1710 Hz

Bilobalide is a compound specific to ginkgo leaves (Ginkgo biloba), a tree considered a 'living fossil', present on Earth for millions of years. Ginkgo is traditionally associated with circulation and memory, and remains one of the most studied and sold plants in the world. Its Auralis frequency (243.17 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 972.68 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Caffeine 289.4353 Hz

Caffeine is the most consumed stimulant on the planet, naturally present in coffee, tea, cocoa, maté and guarana. It works by blocking adenosine, the molecule that promotes the feeling of tiredness, hence its effect of wakefulness and alertness. Consumed for centuries in the form of drinks, it is inseparable from many cultures. Its Auralis frequency (289.44 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 578.87 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Carnosic acid 247.7393 Hz

Carnosic acid is one of the main antioxidants of rosemary and sage; it is partly what helps these aromatic plants protect food from oxidation. Studied for its antioxidant properties, it is associated in tradition with the tonic virtues of rosemary. It is extracted from the leaves of these Mediterranean herbs. Its Auralis frequency (247.74 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 990.96 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Castor oil 222.4236 Hz

Castor oil is extracted from the seeds of the castor plant (Ricinus communis). Thick and rich in ricinoleic acid, it is traditionally used in external care for the skin, hair, eyelashes and nails, as well as in the famous 'poultices' of tradition. Its Auralis frequency (222.42 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 889.69 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Cayenne 227.6030 Hz

Cayenne pepper is a hot pepper whose active compound, capsaicin, is responsible for the sensation of heat in the mouth. Beyond cooking, it is traditionally used to stimulate circulation and warm, and capsaicin is included in some balms for muscle comfort. Its Auralis frequency (227.60 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 910.41 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Chlorophyll 166.4656 Hz

Chlorophyll is the pigment that gives plants their green color and allows them to capture the sun's energy for photosynthesis — the process that feeds almost all life on Earth. Its structure is strikingly similar to that of the hemoglobin in our blood. It is found in all green vegetables. Its Auralis frequency (166.47 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 2663.45 Hz; it has been lowered by 4 octaves to fit Auralis's listening range.

Chrysin 189.4692 Hz

Chrysin is a flavonoid found in passionflower, bee propolis and honey. It contributes to the soothing reputation of passionflower (passion flower), a plant traditionally used in herbal tea to promote calm and peaceful sleep. It is studied for its antioxidant properties. Its Auralis frequency (189.47 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 757.88 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Cordycepin 187.2335 Hz

Cordycepin is the characteristic compound of cordyceps, a mushroom that grows at altitude on the high Himalayan plateaus and is highly prized in Chinese and Tibetan traditions. There cordyceps is traditionally associated with energy, endurance and vitality. Its Auralis frequency (187.23 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 748.93 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Coriander 232.9165 Hz

Coriander is an aromatic herb cultivated since antiquity, whose fresh leaves and seeds are both used. Present in cuisines around the world, it is traditionally associated with digestive comfort and is sometimes mentioned for its role in eliminating certain metals. Its Auralis frequency (232.92 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 465.83 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Curcumin 137.2653 Hz

Curcumin is the yellow-orange pigment of turmeric, the root that gives curry its color. Used for millennia in Indian cooking and Ayurvedic medicine, it is one of the most studied natural compounds in the world for its antioxidant properties. Turmeric is traditionally associated with joint and digestive comfort. Its Auralis frequency (137.27 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 1098.12 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Echinacoside 146.5752 Hz

Echinacoside is one of the compounds of echinacea (Echinacea), a purple flower native to North America, used by Indigenous peoples and then made very popular in herbal medicine. Echinacea is traditionally associated with supporting the natural defenses, especially in the cold season. Its Auralis frequency (146.58 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 2345.20 Hz; it has been lowered by 4 octaves to fit Auralis's listening range.

EGCG 170.7973 Hz

EGCG (epigallocatechin gallate) is the most abundant and most studied catechin of green tea. It is a powerful antioxidant that contributes to the health reputation of this drink consumed for millennia in Asia. Green tea is traditionally associated with vitality and longevity. Its Auralis frequency (170.80 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1366.38 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Erinacine A 155.2143 Hz

Erinacine A is a characteristic compound of Hericium erinaceus, a white mushroom with long spines nicknamed 'lion's mane' or 'monkey head'. Used in Asian tradition, it is today much studied for its possible link with nerve cells, which connects it to a reputation for cognitive support. Its Auralis frequency (155.21 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1241.71 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Faradiol 164.9658 Hz

Faradiol is one of the active compounds of calendula flowers (Calendula officinalis), the pot marigold. This orange flower is traditionally used in skin care — in balms, creams and macerated oils — for its soothing action on irritations. Its Auralis frequency (164.97 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 1319.73 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Ferulic acid 289.4204 Hz

Ferulic acid is a phenolic acid that plants make to stiffen their cell walls; it is abundant in rice bran, wheat bran, coffee and many fruits. It is a widely used antioxidant in cosmetics, where it notably serves to stabilize vitamins C and E. A curiosity: its molar mass (194.18 g/mol) is almost identical to that of caffeine (194.19), so the two molecules land less than a hundredth of a hertz apart. Its Auralis frequency (289.42 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 578.84 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Galbanic acid 148.4848 Hz

Galbanic acid is a sesquiterpene coumarin specific to Ferula species, and in particular to Ferula gummosa, whose resin — galbanum — has been used since antiquity in perfumery and incense; it already appears among the ingredients of the sacred perfume described in Exodus. A close relative of umbelliprenin, it differs by two extra oxygen atoms, which is enough to shift its frequency clearly. Its Auralis frequency (148.48 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1187.88 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Ganoderic acid A 192.5209 Hz

Ganoderic acid A is one of the characteristic compounds of reishi (Ganoderma lucidum), a mushroom nicknamed the 'mushroom of immortality' in traditional Chinese medicine, where it has been used for millennia. It belongs to the family of triterpenes, studied for their properties. Reishi is traditionally associated with vitality and balance. Its Auralis frequency (192.52 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1540.17 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Ginkgolide A 152.1775 Hz

Ginkgolide A is part of the ginkgolides, molecules specific to ginkgo (Ginkgo biloba), one of the oldest trees on the planet. These compounds contribute to the reputation of ginkgo, traditionally associated with circulation and memory. Its Auralis frequency (152.18 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1217.42 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Ginkgolide B — 158.1394 Hz

Ginkgolide B is the most studied of the ginkgolides, those molecules characteristic of ginkgo leaves. Ginkgo, a 'living fossil' present for millions of years, is traditionally associated with memory and good circulation, and remains one of the most used plants in the world. Its Auralis frequency (158.14 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 1265.12 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Ginkgolide C — 164.1013 Hz

Ginkgolide C belongs to the family of ginkgolides, molecules found only in ginkgo (Ginkgo biloba). Like its cousins, it contributes to the unique profile of this ancestral tree, traditionally associated with circulation, memory and vitality. Its Auralis frequency (164.10 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1312.81 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Ginsenoside Rb1 — 206.6711 Hz

Ginsenoside Rb1 is one of the main ginsenosides, the active compounds of ginseng (Panax ginseng). An emblematic root of traditional Chinese and Korean medicine, ginseng has been used there for millennia and is traditionally associated with energy, stress resistance and vitality. Its Auralis frequency (206.67 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 3306.74 Hz; it has been lowered by 4 octaves to fit Auralis's listening range.

Ginsenoside Rg1 — 149.2357 Hz

Ginsenoside Rg1 is part of the ginsenosides, the signature molecules of ginseng. Ginseng is one of the most renowned 'adaptogenic' plants, traditionally used in Asia to support energy, concentration and resistance to fatigue. Its Auralis frequency (149.24 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 2387.77 Hz; it has been lowered by 4 octaves to fit Auralis's listening range.

Ginsenoside Rg3 — 146.2547 Hz

Ginsenoside Rg3 is a ginsenoside often more concentrated in red ginseng, obtained by steaming the root. It is the subject of much research. Ginseng remains, in Asian tradition, a symbol of vitality and longevity. Its Auralis frequency (146.25 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 2340.08 Hz; it has been lowered by 4 octaves to fit Auralis's listening range.

Grapefruit — 216.3201 Hz

Grapefruit is a citrus fruit rich in vitamin C and in flavonoids such as naringin, which gives it its bitterness. Grapefruit seed extract is traditionally valued in natural use. Note: grapefruit can interact with many medications, a well-known fact in pharmacology. Its Auralis frequency (216.32 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1730.56 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Honokiol — 198.4791 Hz

Honokiol is one of the active compounds of magnolia bark (Magnolia officinalis), used for centuries in traditional Chinese and Japanese medicine. There magnolia is traditionally associated with relaxation, calm and sleep. Its Auralis frequency (198.48 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 793.92 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Huperzine A — 180.5860 Hz

Huperzine A is a molecule extracted from a Chinese moss, Huperzia serrata, used in traditional Chinese medicine. It is particularly studied for its action on acetylcholine, a memory neurotransmitter, which links it to the cognitive reputation of this plant. Its Auralis frequency (180.59 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 722.34 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Isovitexin — 161.1129 Hz

Isovitexin is an antioxidant flavonoid present in several plants, including passionflower, millet, bamboo and some cereals. Like other flavonoids of passionflower, it contributes to the traditional soothing reputation of this flower. Its Auralis frequency (161.11 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1288.90 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

L-Theanine — 259.6407 Hz

An amino acid characteristic of green tea (Camellia sinensis), where it contributes to the gentle flavor known as 'umami'. It is found almost exclusively in tea and a few mushrooms. Since tea has been consumed for millennia in Asia, L-theanine accompanies one of the oldest drinks in the world. It is reputed to promote a state of attentive calm — relaxation without drowsiness — and is often mentioned alongside the caffeine of tea, with which it is said to form a pair with gentler energy than coffee. Its Auralis frequency (259.64 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 519.28 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

L-Tyrosine 270.0592 Hz

L-tyrosine is an amino acid the body uses as raw material to make dopamine, noradrenaline and thyroid hormones. It is found in protein-rich foods: cheese, soy, meat, eggs, nuts. It is traditionally offered as a supplement with alertness and concentration in mind, notably during periods of fatigue. Its Auralis frequency (270.06 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 540.12 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Lutein 211.9716 Hz

Lutein is a carotenoid, a natural yellow-orange pigment present in leafy green vegetables (spinach, kale), corn and egg yolk. The body concentrates it in the retina, particularly the macula, where it acts as a protective filter against light. It is traditionally associated with eye health. Its Auralis frequency (211.97 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 1695.77 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Macamide 128.7621 Hz

Macamides are compounds specific to maca (Lepidium meyenii), a root that grows at high altitude in the Peruvian Andes, cultivated for millennia. Maca is traditionally associated with energy, endurance and vitality. Its Auralis frequency (128.76 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1030.10 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Madecassoside 181.6759 Hz

Madecassoside is one of the active principles of gotu kola (Centella asiatica), a plant of Ayurvedic and Chinese medicine. It is particularly studied and used in cosmetics for its soothing and repairing properties on the skin. Gotu kola is traditionally associated with healing and longevity. Its Auralis frequency (181.68 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 2906.81 Hz; it has been lowered by 4 octaves to fit Auralis's listening range.

Magnolol 198.4791 Hz

Magnolol is, together with honokiol, one of the two major compounds of magnolia bark (Magnolia officinalis), used for centuries in traditional Chinese and Japanese medicine. There magnolia is traditionally associated with relaxation, easing of the mind and sleep. Its Auralis frequency (198.48 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 793.92 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Piperine 212.6461 Hz

Piperine is the alkaloid that gives black pepper its characteristic pungent flavor. Beyond taste, it is known for improving the body's absorption of other compounds — which is why it is often combined with curcumin in supplements. Pepper is one of the oldest and most traded spices in history. Its Auralis frequency (212.65 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 850.58 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Quercetin 225.2376 Hz

Quercetin is one of the most widespread antioxidant flavonoids in the diet: it is found in onion, apple, capers, berries, tea and red wine. It gives plants part of their colors and protects them. It is studied for its antioxidant properties and is associated, in tradition, with seasonal respiratory comfort. Its Auralis frequency (225.24 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 900.95 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Resveratrol 170.0930 Hz

Resveratrol is an antioxidant produced by certain plants to defend themselves, concentrated in grape skin, red wine, blueberries and peanuts. It was made famous by the 'French paradox' and is the subject of much research on cellular aging. It is traditionally associated with vitality and longevity. Its Auralis frequency (170.09 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 680.37 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Rosavin 159.6411 Hz

Rosavin is one of the characteristic compounds of rhodiola (Rhodiola rosea), a plant that grows in the cold, mountainous regions of the northern hemisphere. A classic 'adaptogenic' plant, rhodiola is traditionally associated with resistance to stress, fatigue and endurance, notably in Scandinavian and Russian traditions. Its Auralis frequency (159.64 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1277.13 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Rosmarinic acid — 134.2583 Hz

Rosmarinic acid is an antioxidant very widespread in aromatic plants of the Lamiaceae family — rosemary, lemon balm, basil, sage, oregano. It contributes to their flavor and protects them. Studied for its antioxidant and soothing properties, it is associated with the traditional reputation of lemon balm as a relaxation plant. Its Auralis frequency (134.26 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1074.07 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Salidroside — 223.7948 Hz

Salidroside is, together with rosavin, one of the two most studied active compounds of rhodiola (Rhodiola rosea). This plant of cold climates is reputed in tradition as an adaptogen helping the body cope with stress and fatigue. Its Auralis frequency (223.79 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 895.18 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Schisandrin A — 155.1994 Hz

Schisandrin A is one of the active compounds of schisandra (Schisandra chinensis), a berry nicknamed the 'five-flavor fruit' in traditional Chinese medicine, where it is classed among the great adaptogens. There schisandra is traditionally associated with energy, balance and vitality. Its Auralis frequency (155.20 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1241.60 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Schisandrin B — 149.2226 Hz

Schisandrin B (or gomisin) is a compound of schisandra particularly studied for its possible role in protecting the liver. This red berry of Chinese tradition is reputed adaptogenic, associated with resistance to stress and vitality. Its Auralis frequency (149.22 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 1193.78 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Schisandrin C — 143.2421 Hz

Schisandrin C is part of the lignans of schisandra, the 'five-flavor' berry of Chinese pharmacopoeia. Like the other compounds of this adaptogenic plant, it is studied for its properties, notably on the liver and resistance to stress. Its Auralis frequency (143.24 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1145.94 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Sulforaphane — 264.2463 Hz

Sulforaphane is a sulfur compound released when cruciferous vegetables — broccoli, cabbage, cauliflower, arugula — and especially young broccoli sprouts are chewed or cut. It is one of the most studied plant compounds for its antioxidant properties and its support of the cells' natural defenses. Its Auralis frequency (264.25 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 528.49 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Theobromine — 268.5240 Hz

Theobromine is the main stimulant molecule of cocoa — its Greek name means 'food of the gods'. Gentler and longer-lasting than caffeine, it contributes to the sense of well-being associated with dark chocolate. Cocoa was considered sacred by the Mayans and Aztecs. Its Auralis frequency (134.26 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 537.05 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Umbelliprenin — 136.5648 Hz

Umbelliprenin is a sesquiterpene coumarin: a molecule of umbelliferone — the compound behind the characteristic scent of cut hay — onto which a long farnesyl chain is grafted. It is found in Ferula species, the tall umbellifers that yield galbanum and asafoetida, as well as in several plants of the carrot and celery family. It is one of the most studied compounds of that botanical genus. Its Auralis frequency (136.56 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1092.52 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Valerenic acid — 174.6315 Hz

Valerenic acid is the signature molecule of valerian root (Valeriana officinalis), a plant used since antiquity. Valerian is one of the plants most traditionally associated with relaxation, calm and falling asleep, and appears in many evening herbal teas. Its Auralis frequency (174.63 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 698.53 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Valtrate — 157.4202 Hz

Valtrate is part of the valepotriates, compounds specific to valerian root (Valeriana officinalis). Valerian is one of the plants most anciently and traditionally associated with relaxation and sleep, used in herbal tea since Greco-Roman antiquity. Its Auralis frequency (157.42 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 1259.36 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Vinpocetine 130.5842 Hz

Vinpocetine is a molecule derived from a compound of the lesser periwinkle (Vinca minor), a blue-flowered plant of European woodlands. It is studied for its action on cerebral blood circulation and traditionally associated with memory and mental clarity. Its Auralis frequency (130.58 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1044.67 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Vitexin 161.1129 Hz

Vitexin is an antioxidant flavonoid found notably in hawthorn, passionflower and millet. It contributes to the traditional reputation of hawthorn, a shrub long associated with heart comfort and nervous calm. Its Auralis frequency (161.11 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 1288.90 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Wild yam 154.4952 Hz

Wild yam (Dioscorea) is a tropical root from which diosgenin is extracted, a molecule that historically served as a base for making synthetic hormones. Yam is traditionally associated, in herbalism, with female balance and menopausal comfort. Its Auralis frequency (154.50 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1235.96 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Withaferin A 175.3544 Hz

Withaferin A is one of the active compounds of ashwagandha (Withania somnifera), also called 'Indian ginseng', one of the most important plants of Ayurvedic medicine. An adaptogen par excellence, ashwagandha is traditionally associated with resistance to stress, calm and vitality — its Sanskrit name indeed evokes strength. Its Auralis frequency (175.35 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1402.84 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Essential oils (15)

1,8-Cineole 229.9058 Hz

1,8-cineole, also called eucalyptol, is the molecule behind the fresh, penetrating note of eucalyptus, rosemary and sage. It is one of the most characteristic compounds of 'respiratory' essential oils. In traditional aromatherapy, eucalyptus is associated with a sense of clearing and the fresh air of winter. Its Auralis frequency (229.91 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 459.81 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Alpha-Pinene 203.0474 Hz

Alpha-pinene is the molecule that gives its coniferous forest scent to pine and fir needles; it is also found in rosemary, basil and frankincense. It is one of the compounds behind the sensation of a 'forest bath'. In traditional aromatherapy, pine scents are associated with pure air and liveliness. Its Auralis frequency (203.05 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 406.09 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Bisabolol 165.7185 Hz

Bisabolol is one of the gentlest compounds of chamomile (and of candeia wood). Widely used in cosmetics for its extreme softness, it is associated with soothing skin care. In traditional aromatherapy, chamomile evokes comfort and serenity. Its Auralis frequency (165.72 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 662.87 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Camphor 226.8950 Hz

Camphor is a molecule with a powerful, fresh and penetrating aroma, traditionally extracted from the wood of the camphor tree, an Asian tree. It is best known in warming balms and 'decongestant' preparations. In traditional use, it is associated with the sensation of warmth and muscle comfort. Its Auralis frequency (226.90 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 453.79 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Carvacrol 223.8992 Hz

Carvacrol is the compound that gives oregano and savory their characteristic warm, spicy scent. It is one of the most studied aromatic compounds for its natural antimicrobial properties. These Mediterranean herbs are traditionally associated with robustness and support of the body. Its Auralis frequency (223.90 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 447.80 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Cinnamaldehyde 196.9812 Hz

Cinnamaldehyde is the molecule responsible for the warm, sweet and woody aroma of cinnamon. A precious spice traded since antiquity, cinnamon is traditionally associated with warmth, comfort and the conviviality of cold seasons. The compound is also studied for its antimicrobial properties. Its Auralis frequency (196.98 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 393.96 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Citronellal — 229.9058 Hz

Citronellal is the molecule behind the lemony note of lemon balm, citronella and lemon eucalyptus. It is classically associated with fresh summer scents and with keeping insects away. Lemon balm, a garden herb of European traditions, is reputed to be soothing. Its Auralis frequency (229.91 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 459.81 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Eugenol — 244.7360 Hz

Eugenol is the molecule that gives clove its recognizable warm, spicy scent; it is also found in cinnamon and basil. Traditionally, clove is associated with dental comfort and the warmth of spices. It is an ancient spice, long as precious as gold. Its Auralis frequency (244.74 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 489.47 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Geraniol — 229.9058 Hz

Geraniol is the molecule with the sweet scent of rose and geranium, present in the essential oils of rose, geranium, palmarosa and citronella. It is one of the great pillars of floral perfumery. Rose scents are traditionally associated with softness, harmony and the heart. Its Auralis frequency (229.91 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 459.81 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Limonene — 203.0474 Hz

Limonene is the molecule that gives citrus fruits — lemon, orange, grapefruit — their bright, sunny scent; it is found concentrated in their peel. It is one of the scents most universally perceived as fresh and joyful. In traditional aromatherapy, citrus fruits are associated with good mood and vitality. Its Auralis frequency (203.05 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 406.09 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Linalol — 229.9058 Hz

The main aromatic molecule of true lavender (Lavandula angustifolia), responsible for its floral, fresh scent. It is also found in rosewood, bergamot and coriander. Lavender has been cultivated since antiquity in the Mediterranean, where it already scented linen and baths — its name comes from the Latin lavare, 'to wash'. In traditional aromatherapy, it is reputed for its soothing atmospheres and its use at bedtime, and remains one of the most popular essential oils in the world. Its Auralis frequency (229.91 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 459.81 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Linalyl acetate — 292.5653 Hz

Linalyl acetate is, together with linalool, one of the two major molecules of true lavender and bergamot; it is what gives these oils their floral, soft and fruity note. In traditional aromatherapy, it contributes to the soothing reputation of lavender, widely used for relaxation and bedtime. Its Auralis frequency (292.57 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 585.13 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Menthol — 232.9165 Hz

Menthol is the emblematic molecule of peppermint: it is what produces that famous cooling sensation by activating the cold receptors of the skin and mouth. It is used everywhere, from candies to balms. Mint is traditionally associated with freshness, digestive comfort and clarity. Its Auralis frequency (232.92 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 465.83 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Tea tree — 229.9058 Hz

Tea tree essential oil (Melaleuca alternifolia) is extracted from an Australian shrub, traditionally used by Aboriginal peoples. It is one of the most popular essential oils, reputed for its purifying and cleansing properties, often used for the skin. Its Auralis frequency (229.91 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 459.81 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Thymol 223.8992 Hz

Thymol is the compound with the warm, powerful scent of thyme (and oregano). Long recognized for its antiseptic properties, it even gave its name to hygiene products. Thyme is a Mediterranean herb traditionally associated with robustness, respiratory support and protection. Its Auralis frequency (223.90 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 447.80 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Endogenous (32)

Acetylcholine 217.9223 Hz

Acetylcholine is one of the first neurotransmitters ever discovered: it carries messages between neurons, but also between nerves and muscles, whose contraction it triggers. In the brain, it plays a key role in attention, learning and memory. The body makes it from choline, a nutrient found in eggs and soy. Its Auralis frequency (217.92 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 435.84 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Adenosine 199.1573 Hz

Adenosine is a fundamental molecule of life: it forms the basis of ATP (cellular energy) and of DNA. Over the course of the day, it builds up in the brain and promotes the feeling of tiredness, preparing for sleep — indeed it is its action that caffeine blocks. It is also involved in circulation and heart rhythm. Its Auralis frequency (199.16 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 796.63 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Alpha-GPC 191.6900 Hz

Alpha-GPC is a natural form of choline found in the body and in foods such as milk and organ meats. The choline it releases is used notably to make acetylcholine, a memory neurotransmitter, and forms part of the structure of cell membranes. This is why it is studied and offered as a supplement linked to cognitive function. Its Auralis frequency (191.69 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 766.76 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

ATP 188.9848 Hz

ATP (adenosine triphosphate) is the true 'battery' of cells: it is the molecule that stores and releases the energy needed for almost every function of the body, from the beating of the heart to thought. Each cell constantly recycles enormous amounts of it. Produced mainly in the mitochondria from food and oxygen, it is at the heart of metabolism. Its Auralis frequency (188.98 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1511.88 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Citicoline 181.9572 Hz

Citicoline (or CDP-choline) is a molecule the body makes naturally and which takes part in building cell membranes, particularly in the brain. It is a source of choline and is involved in the synthesis of neurotransmitters. It is studied for its role in cognitive function and is used as a supplement. Its Auralis frequency (181.96 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 1455.66 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Coenzyme Q10 160.8483 Hz

Coenzyme Q10, or ubiquinone, is a molecule present in all cells, where it plays a central role in energy production within the mitochondria. It is also an antioxidant that protects cells. The body makes some, and it is found in oily fish, meat and organ meats; its presence tends to decrease with age, hence its common use as a supplement. Its Auralis frequency (160.85 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 2573.57 Hz; it has been lowered by 4 octaves to fit Auralis's listening range.

Creatine 195.4460 Hz

Creatine is a molecule the body produces and stores mainly in the muscles, where it allows energy to be regenerated very quickly during short, intense efforts. It is also supplied by meat and fish. It is one of the most studied supplements in sport, traditionally associated with strength and muscle recovery. Its Auralis frequency (195.45 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 390.89 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

DHEA 214.9414 Hz

DHEA (dehydroepiandrosterone) is a hormone produced by the adrenal glands. It is a 'mother' molecule: the body uses it as a precursor to make other hormones, including testosterone and estrogens. Its level peaks in young adulthood and then declines with age, which makes it a topic of interest in aging. Its Auralis frequency (214.94 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 859.77 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Dopamine 228.3110 Hz

Dopamine is a central neurotransmitter of the brain, involved in motivation, pleasure, reward-based learning and the control of movement. Often referred to as the 'reward molecule', it drives us to act and to seek out what makes us feel good. The body makes it from an amino acid, tyrosine, found in food. Its Auralis frequency (228.31 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 456.62 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Endorphin 161.3877 Hz

Endorphin — more precisely β-endorphin — is a peptide produced by the brain, considered a 'natural opioid'. It is associated with pleasure, pain relief and the feeling of euphoria, notably after physical exercise (the famous 'runner's high'). It is also boosted by laughter, music or chocolate. Its Auralis frequency (161.39 Hz) derives from its molar mass — approximate here, as it is a large peptide. Its original frequency (molar mass × 2.98095) is 10328.81 Hz; it has been lowered by 6 octaves to fit Auralis's listening range.

Estradiol (E2) 202.9878 Hz

Estradiol — or 17β-estradiol, abbreviated E2 — is the main and most potent estrogen of the reproductive years, produced mainly by the ovaries. Identical to the one the body makes (bio-identical), it is the most prescribed form in hormone therapy: tablets, patches or gels. Beyond reproduction, it also acts on bones, skin, heart and brain. Its Auralis frequency (202.99 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 811.95 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

GABA 153.6978 Hz

GABA (gamma-aminobutyric acid) is the great inhibitory neurotransmitter of the brain: it tempers the activity of neurons and acts as a natural brake against overstimulation. This is why it is traditionally associated with calm, relaxation and falling asleep. The body makes it from glutamate; it is also found in some fermented foods. Its Auralis frequency (153.70 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 307.40 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Ghrelin 157.0057 Hz

Ghrelin is the 'hunger hormone': secreted mainly by the stomach when it is empty, it sends the brain the signal that it is time to eat. It forms a pair with leptin, the satiety hormone, to regulate appetite. It is also involved in sleep and energy management. Its Auralis frequency (157.01 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 10048.37 Hz; it has been lowered by 6 octaves to fit Auralis's listening range.

Glutamate 219.2936 Hz

Glutamate is the great excitatory neurotransmitter of the brain — the 'go' signal opposite the 'brake' of GABA, which it is used to make. It plays a central role in learning and memory. It is also an amino acid naturally present in many foods, behind the famous 'umami' taste. Its Auralis frequency (219.29 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 438.59 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Glutathione 229.0286 Hz

Glutathione is an antioxidant the body makes itself and which is found in each of our cells. It is nicknamed the 'master antioxidant' because it helps neutralize unstable molecules and takes part in detoxification, notably in the liver. Its levels tend to fall with age and stress. Its Auralis frequency (229.03 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 916.11 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Glycine 223.7710 Hz

Glycine is the smallest and simplest of the amino acids that make up our proteins; it is particularly abundant in collagen, the support protein of skin and joints. It also plays the role of a soothing neurotransmitter and is traditionally associated with sleep quality. It is found in bone broths, meat and gelatin. Its Auralis frequency (223.77 Hz) is derived from its molar mass.

Histamine 165.6663 Hz

Histamine is a molecule the body releases as part of immune and allergic reactions — it is what causes itching and sneezing, and what 'antihistamines' target. But it is also a useful messenger: it takes part in wakefulness in the brain and in the secretion of digestive juices. It is also found in some fermented foods. Its Auralis frequency (165.67 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 331.33 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

L-Carnitine 240.2631 Hz

L-carnitine is a molecule that acts as a 'shuttle': it carries fatty acids inside the mitochondria, where they are burned to produce energy. The body makes some from amino acids, and it is found mainly in red meat. It is traditionally associated with energy and performance, and used as a sports supplement. Its Auralis frequency (240.26 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 480.53 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Melatonin 173.1023 Hz

A hormone produced naturally by the body, mainly at night by the pineal gland. It is at the heart of the circadian rhythm — the internal clock that regulates the alternation of wakefulness and rest over 24 hours. Its secretion is directly influenced by light: it rises in darkness and falls in daylight, hence its role as the body's 'night signal'. It is traditionally associated with sleep and is among the best-known supplements for easing falling asleep or reducing jet lag. Its Auralis frequency (173.10 Hz) is derived from its molar mass by the same method. Its original frequency (molar mass × 2.98095) is 692.41 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

NAD+ 247.2065 Hz

NAD+ (nicotinamide adenine dinucleotide) is an indispensable molecule present in every cell, where it acts as a 'carrier' in the reactions that produce energy. It is also involved in DNA repair and in the regulation of cellular aging, which makes it a very active area of research. Its levels decrease with age. The body makes it from vitamin B3. Its Auralis frequency (247.21 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 1977.65 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

NADH 247.9554 Hz

NADH is the 'energy-charged' form of NAD+: it is what carries the electrons from the digestion of food to the mitochondria, where they are used to make ATP. It is therefore a central link in cellular energy production and also has an antioxidant role. It is studied as a supplement linked to energy and alertness. Its Auralis frequency (247.96 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 1983.64 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Nitric oxide 89.4583 Hz

Nitric oxide (NO) is a tiny gaseous molecule the body constantly makes to serve as a messenger. Its best-known role is to relax the walls of blood vessels, which promotes circulation — a discovery rewarded with a Nobel Prize. It is also involved in immunity and communication between neurons. The body makes it from an amino acid, arginine. Its Auralis frequency (89.46 Hz) derives from its molar mass.

Noradrenaline 252.1586 Hz

Noradrenaline (or norepinephrine) is both a neurotransmitter and a hormone, a close cousin of adrenaline. It is at the heart of wakefulness, alertness and attention, and the body releases it in response to stress — the 'fight or flight' reaction. It speeds up the heart rate and sharpens concentration. The body makes it from dopamine. Its Auralis frequency (252.16 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 504.32 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Oxytocin 187.6489 Hz

Oxytocin is a hormone and brain messenger often nicknamed the 'attachment hormone' or 'bonding hormone': it is released during hugs, contact and breastfeeding, and promotes trust and social bonding. It also plays a major physiological role during childbirth and breastfeeding. The body produces it in the hypothalamus. Its Auralis frequency (187.65 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 3002.38 Hz; it has been lowered by 4 octaves to fit Auralis's listening range.

PQQ 246.0849 Hz

PQQ (pyrroloquinoline quinone) is a small molecule with marked antioxidant properties, present in many foods such as natto, parsley, green tea and peppers. It is particularly studied for its possible role in the health and formation of the mitochondria, the cells' energy plants. It is offered as a supplement linked to energy. Its Auralis frequency (246.08 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 984.34 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Progesterone 234.3474 Hz

Progesterone is a key hormone of the female cycle: produced mainly after ovulation, it prepares the uterus for a possible pregnancy and plays a major role during it. It also acts on mood, body temperature and sleep. Like estrogens, its levels vary over the cycle and over life. Its Auralis frequency (234.35 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 937.39 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Serotonin 262.6441 Hz

Serotonin is a neurotransmitter often nicknamed the 'good-mood molecule', involved in regulating mood, appetite and sleep. Surprisingly, most of it is found in the gut, where it takes part in digestion. The body makes it from tryptophan, an amino acid from food, and it is the precursor of melatonin. Its Auralis frequency (262.64 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 525.29 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Taurine 186.5329 Hz

Taurine is a molecule related to amino acids, highly concentrated in the heart, brain, retina and muscles. It takes part in the balance of fluids and minerals within cells and has an antioxidant role. The body makes some, and it is found in seafood, fish and meat; it is also a classic ingredient of energy drinks. Its Auralis frequency (186.53 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 373.07 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Testosterone 214.9414 Hz

Testosterone is the main male sex hormone, produced mainly by the testicles, but also present, in smaller amounts, in women. It influences muscle and bone mass, body hair and the voice, but also energy and mood. Its levels peak in young adulthood and then slowly decline with age. Its Auralis frequency (214.94 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 859.77 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Vitamin B12 126.2591 Hz

Vitamin B12 (cobalamin) is indispensable to the proper functioning of the nervous system and to the making of red blood cells, as well as to DNA metabolism. It is found almost exclusively in animal products — meat, fish, eggs, dairy — which is why it is often supplemented in vegan diets. The body can store several years' worth of it. Its Auralis frequency (126.26 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 4040.29 Hz; it has been lowered by 5 octaves to fit Auralis's listening range.

Vitamin C 262.5084 Hz

Vitamin C, or ascorbic acid, is a vitamin humans cannot make, unlike most animals: it comes from food (citrus fruit, kiwi, bell pepper, parsley). It partners with the enzymes that turn proline into hydroxyproline, a step needed for the stability of collagen fibres. It was isolated in the 1930s by Albert Szent-Györgyi, Nobel laureate in 1937. Its Auralis frequency (262.51 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 525.02 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Vitamin D 143.3233 Hz

Vitamin D is special: the body makes most of it itself, in the skin exposed to the sun. It is essential to the absorption of calcium and therefore to the strength of bones and teeth, and it also plays a role in immunity. It is found in oily fish, egg yolk and fortified foods; in our latitudes, it is often supplemented in winter. Its Auralis frequency (143.32 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 1146.59 Hz; it has been lowered by 3 octaves to fit Auralis's listening range.

Amino acids (10)

Histidine — 231.2546 Hz

Histidine is one of the nine essential amino acids: the body cannot make it and must obtain it from food. It is the starting molecule for histamine, and its imidazole ring makes it a frequent player in enzyme active sites; it also takes part in the structure of hemoglobin. Its Auralis frequency (231.25 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 462.51 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Isoleucine — 195.5131 Hz

Isoleucine is one of the three branched-chain amino acids — the well-known BCAAs — along with leucine and valine. The body cannot synthesize it: it comes from food, particularly animal proteins and legumes. An isomer of leucine, it shares its molar mass exactly: the two molecules therefore carry the same Auralis frequency (195.51 Hz), which derives from that mass. Its original frequency (molar mass × 2.98095) is 391.03 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Leucine — 195.5131 Hz

Leucine is the most abundant of the three BCAAs. Beyond its place as a building block in proteins, it interests researchers as a signalling molecule: it takes part in the cellular pathway that triggers protein synthesis. It is essential — the body cannot make it. An isomer of isoleucine, it has the same molar mass, and therefore the same Auralis frequency (195.51 Hz). Its original frequency (molar mass × 2.98095) is 391.03 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Lysine — 217.8925 Hz

Lysine is an essential amino acid the body uses as a building block of collagen — its residues form the cross-links that give the fibre its strength — and as the starting point for carnitine. It is the so-called 'limiting' amino acid of cereals: wheat and rice contain little of it, whereas legumes are rich in it, which explains the long-standing practice of combining them in one meal. Its Auralis frequency (217.89 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 435.79 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Methionine — 222.3908 Hz

Methionine is the only essential amino acid containing sulphur, and it holds a special place: the translation of a protein almost always starts with it. Converted into SAM-e (S-adenosylmethionine), it becomes the body's main donor of methyl groups — a chemical reaction found everywhere. It is also the gateway to cysteine and glutathione. Its Auralis frequency (222.39 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 444.78 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Phenylalanine — 246.2145 Hz

Phenylalanine is an essential amino acid recognizable by its aromatic ring. The body converts it into tyrosine, which in turn opens the path to dopamine, noradrenaline and adrenaline. It is the molecule at the heart of phenylketonuria, a rare genetic condition in which this conversion does not happen — hence the 'contains a source of phenylalanine' notice on some sweetened products. Its Auralis frequency (246.21 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 492.43 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Proline — 171.5999 Hz

Proline is an amino acid the body can make on its own. Its shape is unique among protein amino acids: its side chain closes into a ring, which forces a rigid bend into any protein that contains it. Together with glycine and hydroxyproline, which is derived from it, it makes up a large share of collagen, the support protein of skin, tendons and bones; its rings help collagen's triple helix keep its shape. Its Auralis frequency (171.60 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 343.20 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Threonine — 177.5439 Hz

Threonine is an essential amino acid identified late: it was the last of the twenty to be discovered, in 1936. It is strongly represented in structural proteins such as collagen and elastin, as well as in mucins, the proteins that form the mucus lining the gut. Its hydroxyl group also makes it a frequent anchor point for the sugars and phosphates that regulate protein activity. Its Auralis frequency (177.54 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 355.09 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Tryptophan 152.1961 Hz

Tryptophan is an essential amino acid, meaning the body cannot make it and must obtain it from food: turkey, eggs, cheese, nuts, seeds. It is the raw material from which the body produces serotonin, then melatonin. It is thus traditionally associated with mood and sleep. Its Auralis frequency (152.20 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 608.78 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Valine 174.6062 Hz

Valine completes the trio of branched-chain amino acids, with leucine and isoleucine. Essential, it comes only from food. Its compact, water-repelling side chain often places it at the core of folded proteins, where they must stay sheltered from water. It is also a textbook example in genetics: a single valine substitution in hemoglobin is enough to completely change the protein's behaviour. Its Auralis frequency (174.61 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 349.21 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Elements (49)

Bicarbonate (HCO3) 181.8856 Hz

Bicarbonate is a central ion in regulating the acidity of the blood and body fluids: it acts as a buffer that neutralizes excess acid. It is found in blood, saliva and digestive juice, as well as in sparkling mineral waters. In the form of baking soda, it is a common household and cooking product. Its Auralis frequency (181.89 Hz) is derived from the molar mass of the ion.

Bismuth 155.7397 Hz

A heavy metal whose iridescent, staircase-shaped crystals are among the most beautiful in the mineral world. Unlike its neighbours in the periodic table, such as lead, it has very low toxicity, and its compounds have long been used in pharmacy and cosmetics. Its Auralis frequency (155.74 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 622.96 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Boron 64.4541 Hz

A relatively rare metalloid, present in trace amounts in the body and in small quantities in fruits, vegetables, nuts and legumes. It is essential to plants and is being researched for its possible role in bone health. Boron produces a characteristic green flame and is used to make highly heat-resistant glass, such as Pyrex. Its Auralis frequency (64.45 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 32.23 Hz; it has been raised by 1 octave to fit Auralis's listening range.

Bromine 238.1898 Hz

The only non-metallic element that is liquid at room temperature, reddish-brown in colour, whose name comes from the Greek brōmos, "stench". It is found mainly in seawater, and the Dead Sea is particularly rich in it. In 2014, researchers at Vanderbilt University described its role in the architecture of tissue collagen. Its Auralis frequency (238.19 Hz) is derived from its molar mass.

Calcium 119.4705 Hz

The most abundant mineral in the body, the vast majority of which is found in the bones and teeth, which it structures. Beyond the skeleton, it takes part in muscle contraction, blood clotting and the transmission of nerve signals. It is found in dairy products, leafy green vegetables, almonds, tofu and some mineral waters. Its Auralis frequency (119.47 Hz) is derived from its molar mass.

Carbon 71.6084 Hz

Carbon is the central element of life: its ability to form long chains makes it the backbone of almost every organic molecule, from sugars to DNA. It appears in very different forms — soft graphite, very hard diamond, or carbon dioxide gas in the air. Chemically, every living organism is an architecture of carbon. Its Auralis frequency (71.61 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 35.80 Hz; it has been raised by 1 octave to fit Auralis's listening range.

Chlorine 105.6747 Hz

An element of the halogen family, best known as chloride: together with sodium it forms table salt. Chloride is one of the body's main minerals; it helps balance water between cells and is part of stomach acid. Its name comes from the Greek khlōros, "pale green", the colour of the gas. Its Auralis frequency (105.67 Hz) is derived from its molar mass.

Chromium 154.9975 Hz

A trace element that the body contains only in traces, supplied by foods such as broccoli, whole grains, meat and yeast. It is studied for its role in carbohydrate metabolism. In metallic form, chromium gives its bright shine to 'chromed' surfaces and its resistance to stainless steels. Its Auralis frequency (155.00 Hz) is derived from its molar mass.

Cobalt 175.6763 Hz

A bluish metal that gave its name to the famous cobalt blue of ceramics and stained glass. In the body it sits at the centre of vitamin B12, a molecule needed to form red blood cells. Its name comes from "kobold", a mine goblin of German legend. Its Auralis frequency (175.68 Hz) is derived from its molar mass.

Copper 189.4274 Hz

A reddish metal known since prehistory, both an essential trace element and a great conductor of electricity. In the body, it takes part in the formation of red blood cells and in the proper functioning of the nerves and immune system. It is supplied by seafood, nuts, seeds, dark chocolate and organ meats. Its Auralis frequency (189.43 Hz) derives from its molar mass.

Fluorine 113.2642 Hz

A highly reactive element whose form useful to the body, fluoride, is mainly known for strengthening tooth enamel — hence its presence in many toothpastes and waters. It is found naturally in water, tea, fish and some plants. In pure form, fluorine is an extremely reactive yellowish gas. Its Auralis frequency (113.26 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 56.63 Hz; it has been raised by 1 octave to fit Auralis's listening range.

Germanium 216.5064 Hz

A shiny grey metalloid, predicted by Mendeleev even before its discovery in 1886, and named in honour of Germany. It was used to make the first transistors and is still used in optical fibre and infrared optics. In the wellness world it is known as "organic germanium". Its Auralis frequency (216.51 Hz) is derived from its molar mass.

Gold 293.5744 Hz

The precious metal par excellence, gold has fascinated humanity for millennia with its shine and its unalterability — it neither rusts nor tarnishes. Chemically very stable, it is also used in electronics, dentistry and jewelry. Tiny traces of it are found in seawater and the human body. Its Auralis frequency (73.23 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 587.15 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Helium 95.4619 Hz

The second most abundant element in the universe, helium is an ultralight, chemically inert noble gas born in the heart of stars. On Earth it is rare and precious: it is used to cool MRI machines, inflate balloons and airships, and in many scientific applications. When breathed, it makes the voice high-pitched because sound travels faster through it. Its Auralis frequency (95.46 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 11.93 Hz; it has been raised by 3 octaves to fit Auralis's listening range.

Hydrogen 96.1535 Hz

The lightest and most abundant element in the Universe: it makes up most of the stars, and every water molecule contains two of its atoms. In the human body it is the most numerous atom, present in water and in every molecule of life. Its name means "water-maker". Its Auralis frequency (96.15 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 3.00 Hz; it has been raised by 5 octaves to fit Auralis's listening range.

Iodine 189.1472 Hz

A trace element indispensable to the thyroid, the gland that regulates metabolism; this is why table salt is often enriched with iodine. It is found mainly in seafood, seaweed, fish and shellfish. In pure form, iodine is a dark violet solid that sublimates into purple vapors. Its Auralis frequency (189.15 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 378.29 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Iridium 286.4946 Hz

A precious metal of the platinum family, one of the densest and most corrosion-resistant of all. Its name comes from Iris, goddess of the rainbow, for the varied colours of its salts. A thin iridium-rich layer, found all over the Earth, marks the impact of the asteroid that ended the age of the dinosaurs. Its Auralis frequency (286.49 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 572.99 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Iron 166.4712 Hz

A mineral indispensable to life: at the heart of hemoglobin, it carries oxygen from the lungs to the whole body. It is also one of the metals that shaped human history, from the Iron Age to modern steel. It is supplied by red meat, legumes, spinach, blood sausage and dried fruit. Its Auralis frequency (166.47 Hz) derives from its molar mass.

Krypton 249.7976 Hz

A rare noble gas of the atmosphere, whose name comes from the Greek kryptos, "hidden". It is used in some lamps and insulated windows, and the wavelength of its light served as the official definition of the metre from 1960 to 1983. Its Auralis frequency (249.80 Hz) is derived from its molar mass.

Lithium 82.7631 Hz

Lithium is the lightest metal, so low in density that it floats on water. It is today at the heart of the batteries in our phones and electric cars. It is found in trace amounts in some mineral waters, plants and grains. Its Auralis frequency (82.76 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 20.69 Hz; it has been raised by 2 octaves to fit Auralis's listening range.

Magnesium 72.4520 Hz

An essential mineral present in green vegetables, nuts, seeds, legumes, cocoa and some mineral waters. In the body, it is involved in hundreds of enzyme reactions and contributes to the functioning of the nervous system and muscles as well as to electrolyte balance. It is one of the most studied minerals in nutrition and one of the most common in wellness supplements. It is traditionally associated with relaxation, recovery and quality of rest. In Auralis, its 72.45 Hz frequency derives from its molar mass (24.305 g/mol), brought by octaves into the audible range.

Manganese 163.7674 Hz

A trace element that the body uses in small amounts in many enzymes, notably those that protect cells and take part in metabolism. It is supplied by whole grains, nuts, legumes, tea and leafy vegetables. As a metal, manganese is used mainly to harden steel. Its Auralis frequency (166.47 Hz) is derived from its molar mass.

Methylene blue 238.3642 Hz

A synthetic compound of deep blue, methylene blue was one of the first artificial dyes, before becoming a valuable laboratory tool for staining cells and tissues under the microscope. It also has a long history of medical uses, as a marker and as an antidote in certain poisonings, and is today the subject of varied research. Its Auralis frequency (238.36 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 953.46 Hz; it has been lowered by 2 octaves to fit Auralis's listening range.

Molybdenum 286.0222 Hz

A trace element present in very small amounts in the body, where it acts as a cofactor for enzymes that help process certain compounds and medications. It is supplied mainly by legumes, whole grains and nuts. As a metal, molybdenum withstands extreme temperatures and strengthens steels. Its Auralis frequency (286.02 Hz) derives from its molar mass.

Neon 60.1556 Hz

A noble gas, the fifth most abundant element in the Universe, present in tiny amounts in the air. It gives off its famous reddish-orange glow in the tubes of neon signs. Its name comes from the Greek neos, "new". Its Auralis frequency (60.16 Hz) is derived from its molar mass.

Nickel 174.9609 Hz

A silvery metal that strongly resists corrosion, used in stainless steel, coins and batteries. It is found in very small amounts in food, notably cocoa, nuts and legumes. It is also one of the most common causes of contact allergy to jewellery. Its Auralis frequency (174.96 Hz) is derived from its molar mass.

Nitrogen 83.5083 Hz

A colorless, odorless gas that makes up nearly 78% of Earth's atmosphere. Despite its discretion, nitrogen is everywhere in living things: every amino acid, every strand of DNA and chlorophyll contains it. Plants depend on it to grow, which makes it the basis of most fertilizers, and in liquid form it is used to preserve cells and food by cold. In Auralis, its 83.51 Hz frequency is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 41.75 Hz; it has been raised by 1 octave to fit Auralis's listening range.

Osmium **283.5331 Hz**

The densest of all naturally occurring elements, from the platinum family, with a bluish sheen. Its name comes from the Greek osmē, "smell", because of the strong odour of its oxide. Alloyed with iridium, it was once used for fountain-pen nibs and record-player needles. Its Auralis frequency (283.53 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 567.07 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Oxygen **95.3844 Hz**

Oxygen, which makes up about 21% of the air, is the gas on which almost all life depends: our cells use it to turn food into energy. Produced by plants and algae during photosynthesis, it is also the most abundant element in Earth's crust and in the human body, mostly as water. Without it, neither combustion nor respiration would be possible. Its Auralis frequency (95.38 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 47.69 Hz; it has been raised by 1 octave to fit Auralis's listening range.

Palladium **158.6163 Hz**

A silvery-white precious metal of the platinum family, named after the asteroid Pallas, discovered shortly before it. It is used in jewellery, catalytic converters and dentistry. It has the unique ability to absorb up to 900 times its own volume of hydrogen. Its Auralis frequency (158.62 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 317.23 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Phosphorus **92.3319 Hz**

An essential mineral that, together with calcium, structures the bones and teeth. It is also at the heart of DNA and of ATP, the molecule that stores the cells' energy. It is supplied by meat, fish, eggs, dairy products and legumes. Its Auralis frequency (92.33 Hz) is derived from its molar mass.

Platinum **290.7678 Hz**

A precious metal rarer than gold, gray-white, dense and remarkably resistant to corrosion. It is used in fine jewelry, but above all as a catalyst — notably in the catalytic converters of cars and in the chemical industry. It is also used in some medical equipment. Its Auralis frequency (72.53 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 581.54 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Potassium **116.5492 Hz**

One of the most important minerals in the body: it regulates fluid balance and enables the transmission of nerve signals and the contraction of muscles, including the heart. It works in tandem with sodium. It is found in banana, potato, legumes, spinach and avocado. Its Auralis frequency (116.55 Hz) is derived from its molar mass.

Rhenium **277.5369 Hz**

One of the rarest elements in Earth's crust, rhenium has one of the highest melting points of all metals. This is why it is used in the turbine blades of jet engines and in some catalysts of the oil industry. It has no known biological role. Its Auralis frequency (277.54 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 555.07 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Rhodium **153.3788 Hz**

One of the rarest and often the most expensive of the precious metals, from the platinum family. Its name comes from the Greek rhodon, "rose", for the colour of its salts. It gives many pieces of jewellery their bright white shine and is used in catalytic converters. Its Auralis frequency (153.38 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 306.76 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Rubidium **254.7758 Hz**

A light alkali metal so reactive that it ignites in air, present in small amounts almost everywhere in rocks, seawater and some foods such as coffee or banana. The body treats it somewhat like potassium. It is used mainly in atomic clocks and research. Its Auralis frequency (254.78 Hz) is derived from its molar mass.

Ruthenium **150.6423 Hz**

A hard, rare metal of the platinum family, named after Ruthenia, the old Latin name for Russia, where it was discovered in ores from the Urals. It is used to harden platinum and palladium in jewellery and in some electronic components. Its Auralis frequency (150.64 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 301.28 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Selenium **235.4086 Hz**

A trace element the body needs only in very small amounts, but which is involved in enzymes with antioxidant properties and in the proper functioning of the thyroid. The Brazil nut is its most concentrated source; it is also found in seafood, eggs and cereals. Its Auralis frequency (235.41 Hz) derives from its molar mass.

Silicon 83.7200 Hz

After oxygen, silicon is the most abundant element in Earth's crust: it is the main component of sand, quartz and glass. It is also the heart of modern electronics — the chips in our devices are etched into silicon. Present in traces in the body, it is associated with connective tissue, skin and nails. Its Auralis frequency (83.72 Hz) derives from its molar mass.

Silver 160.7746 Hz

A bright white metal, the best conductor of electricity and heat of all metals. Its symbol Ag comes from the Latin argentum. It has been worked since antiquity in jewellery, silverware and coinage, and today it is used in mirrors, film photography, electronic contacts and solar cells. Its Auralis frequency (160.77 Hz) is derived from its molar mass. Its original frequency (molar mass × 2.98095) is 321.55 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Sodium 68.5320 Hz

Sodium, combined with chlorine, forms table salt. In the body, it regulates water balance and, together with potassium, enables the transmission of nerve impulses and muscle contraction. Naturally present in many foods, it is supplied mainly by added salt. Its Auralis frequency (68.53 Hz) is derived from its molar mass.

Strontium 261.1908 Hz

A metal close to calcium in its chemistry, present in traces in water, seafood and some plants. The body treats it somewhat like calcium, and it is studied for its relationship with bone tissue. Its salts color fireworks and flares bright red. Its Auralis frequency (87.62 Hz) is derived from its molar mass.

Structured Water [H3O2]⁻ 104.3988 Hz

The concept of 'structured water' (sometimes written $[H_3O_2]^-$), a layered form of water linked to research on 'exclusion-zone water'. It is presented as an intermediate state between liquid water and ice, said to be found at the contact of surfaces and in living things. It is an exploratory topic, still debated scientifically. Its Auralis frequency (104.40 Hz) is derived from the molar mass adopted for this form.

Sulfate (SO4) 286.3501 Hz

Sulfate is a very widespread ion, made of sulfur and oxygen, present in seawater, many mineral waters and Epsom salt (magnesium sulfate). In the body, sulfates take part in detoxification and in the structure of cartilage. They are also found in food and in many minerals. Its Auralis frequency (286.35 Hz) derives from the molar mass of the ion.

Sulfur 95.5693 Hz

Sulfur is part of several amino acids, and therefore of all proteins, as well as of many odorous compounds — the smell of garlic, onion or egg. It is supplied by proteins, garlic, onion, cruciferous vegetables and eggs. In pure form, it is a yellow solid known since antiquity. Its Auralis frequency (95.57 Hz) derives from its molar mass.

Titanium 142.6891 Hz

A metal as strong as steel but almost half as heavy, and highly resistant to corrosion. The body tolerates it remarkably well, which is why it is used for dental implants and prostheses. Its name comes from the Titans of Greek mythology. Its Auralis frequency (142.69 Hz) is derived from its molar mass.

Vanadium 151.8556 Hz

A trace element present in tiny traces in the body and in foods such as mushrooms, seafood, parsley and dill. It is studied for its possible role in sugar metabolism. As a metal, vanadium is used mainly to make very strong steels, notably those of tools. Its Auralis frequency (151.86 Hz) is derived from its molar mass.

Xenon 195.6889 Hz

A heavy noble gas, rare and chemically very stable, present in tiny traces in the atmosphere. It produces an intense white light, hence its use in xenon headlights, flashes and some projection lamps. It also has medical applications, notably as an anesthetic agent. Its Auralis frequency (195.69 Hz) derives from its molar mass. Its original frequency (molar mass × 2.98095) is 391.38 Hz; it has been lowered by 1 octave to fit Auralis's listening range.

Zinc 194.8945 Hz

A trace element involved in hundreds of enzymes, zinc takes part in immunity, healing, and the perception of taste and smell. The body does not store it, hence the importance of a regular intake from food: oysters, meat, seeds, nuts and legumes. As a metal, it protects steel from rust through galvanization. Its Auralis frequency (194.89 Hz) is derived from its molar mass.

Auralis is a wellness and relaxation device. It is not a medical device: it does not diagnose, treat or cure any illness. The frequencies have no proven therapeutic effect.
